TITLE: Isotopic shift and quadrupole moments of nonspherical nuclei

SOURCE: Moscow. Institut atomnoy energii. Doklady, no. 717, 1964. Izotopicheskoye smeshcheniye i kvadrupol'nyye momenty okolosfericheskikh yader, 1-14

TOPIC TAGS: isotopic shift, quadrupole moment, nonspherical nucleus, Fermi liquid

ABSTRACT: The authors have calculated the isotopic shift and the quadrupole moments of nuclei that are close to spherical, on the basis of the theory developed by A. B. Migdal for the Fermi liquid of finite systems (ZhETF v. 46, 1680, 1964 and others). Use was made in the calculations of eigenfunctions and eigen-

values of an effective Hamiltonian with a Woods-Saxon potential and with spin-orbit coupling. The matrix elements were calculated and the linear equations solved by means of an electronic computer. An analysis of the results leads to the conclusion that in order to reconcile the data with experiment it is necessary to introduce an interaction amplitude which changes sign and magnitude on the basis of the spin-orbit coupling.

TITLE: Quasi-classical calculation of isotopic shift

SOURCE: Yadernaya fizika, v. 4, no. 5, 1966, 928-935

TOPIC TAGS: nuclear isomer, isotopic shift, particle interaction, nuclear structure, excited nucleus

SUB CODE: 20

ABSTRACT: A quasiclassical method of calculating the isotopic shift on the basis of the finite Fermi system theory is suggested. The analysis confirms the conclusion that it is necessary to introduce an interaction between quasi-particles, changing its magnitude and sign at the nuclear surface. The region of interaction constants satisfying the experimental data is determined. The condition is obtained under which finite Fermi systems are stable with respect to monopole excitations. An analytical formula is obtained for the change of the mean square radius when neutrons are added, taking the nuclear shell structure into account. The results are in good agreement with the experimental data on the isotopic shift of lines in the optical and x-ray region.

19

31  
BSOURCE: Yadernaya fizika, v. 2, no. 1, 1965, 35-39TOPIC TAGS: transition probability, Green function, particle interaction, wave function, beta decay

ABSTRACT: A relation between the masses of neighboring nuclei and the interaction amplitudes is derived from the beta-transition frequencies of mirror nuclei. The Fermi liquid theory of finite systems, developed by A. B. Migdal (Nucl. Phys. v. 57, 29, 1964) is used. The equation for the beta-decay vertex is solved in an approximation wherein the solution is independent of the isospin variables. The radial wave functions and their integrals were calculated with an electronic computer. "The author thanks A. B. Migdal, Ya. A. Smorodinsky, O. G. Bunyatyan, A. I. Larkin, A. A. Lushnikov, and M. A. Troitskiy for interest in the work and

"Experimental Atheromatosis in Guinea Pigs"

Prague, Casopis Lekaru Ceskych, Vol. CII, No 34, 23 August 63,  
pp 921-925.

Abstract [Author's English summary]: A daily peroral administration of 0.2 grams per 100 grams of body weight produced atheromatous changes of aorta in 75 percent of animals within 135 days. In another group a daily administration of cholesterol (0.1 g/100 g), methylthiouracil (0.33 mg/100 g), and cholic acid (1 mg/100 g) produced atheromatous changes in 100 percent of animals within 92 days. Discussed are biochemical macro- & microscopic findings and resistance against atheromatosis. The use of guinea pigs for the study of antisclerotics is considered unsuitable, but they may be used for the research of other problems of lipid metabolism. Twenty-six references, including 9 Czech.

Title : On the Clinical Multiformity of Leukemia in Children.

Orig Pub : Polskie arch. med. wewnętrz., 1957, 27, No 4, 555-558

**Abstract :** Two cases of an unusual course of acute myeloid leukemia in 9 and 12 year old children were described. The disease began in the 1st patient with symptoms of a common inflammation of the middle ear, damage of the facial nerve and marked exophthalmos as a result of leukemic infiltration of the eyeball and of the lacrymal glands. The course of the disease was complicated by a simultaneous onset of measles. The disease in the 2nd child also began with eye damage: swelling of the eyelids, reddening of the conjunctivae and paralysis of the abductor
